SVR Flow Diagram. Firstly, the multi-target dataset is divided into m ST datasets, $\mathcal{D}_1, \mathcal{D}_2, \ldots, \mathcal{D}_m$. Then m models, h_1, h_2, \ldots, h_m , are independently trained for each ST dataset.

Multi-Target Support Vector Regression (SVR)

SVRRC Flow Diagram on a dataset with three targets. SVRRC first builds the six random chains of the target's indices (three examples are shown). It then constructs a chained model by proceeding recursively over the chain, building a model, and appending the current target to the input space to predict the next target in the chain.

Multi-Target SVR with Random-Chains (SVRRC)

Input: Training dataset \mathcal{D} , c random chains \mathcal{C} **Output:** An ensemble of chained models $h_{\mathcal{C}}$

Output: An ensemble of chained models $h_{\mathcal{C}}$ 1: for each $C \in \mathcal{C}$ do

SVRCC Flow Diagram on a sample dataset with three targets. SVRCC first finds the direction of maximum correlation among the targets and uses that order as the only chain. It then constructs the chained model, as done in SVRRC.

A summary of the steps performed by MIRSVM. The representatives are first randomly initialized and continuously updated according to the current hyperplane. Upon completion, the model is returned along with the optimal bag-representatives.
