SVRRC Flow Diagram on a dataset with three targets. SVRRC first builds the six random chains of the target's indices (three examples are shown). It then constructs a chained model by proceeding recursively over the chain, building a model, and appending the current target to the input space to predict the next target in the chain.

Multi-Target SVR with Random-Chains (SVRRC)

SVRCC Flow Diagram on a sample dataset with three targets. SVRCC first finds the direction of maximum correlation among the targets and uses that order as the only chain. It then constructs the chained model, as done in SVRRC.

Summary of the steps performed by OLLAWV. The model parameters ($\boldsymbol{\alpha}$, b, $\boldsymbol{S}$) and the algorithm variables ($\boldsymbol{o}$, t, wv, and yo) are first initialized. The worst-violator with respect to the current hyperplane is then found and the model parameters are updated. Once no violating samples are found, the model is returned.
